

Phase 8: Project Demonstration — Pre-Demo Planning & Readiness Checklist

Project Name: Cab Booking (`UCab`)
Project ID: `N/A (Solo Track Submission)`
Team Member / Solo Developer: Shaik Sumiya Zainab

1. Pre-Demo Environmental Checklist

Before presenting to the evaluation panel or recording your project demo video, verify each item on this technical checklist:

Verification Item	Verification Command / Action	Expected Result	Status
Node.js Environment	<code>`node -v`</code> in terminal	<code>`v18.0.0`</code> or higher	**Ready ' '**
Backend Port Availability	Check nothing is using Port <code>`8000`</code>	Port 8000 free for Express server	**Ready ' '**
Frontend Port Availability	Check nothing is using Port <code>`5173`</code>	Port 5173/5174 free for Vite dev server	**Ready ' '**
Zero-Config Storage Check	Check if <code>`server/db/data.json`</code> exists	File auto-creates and seeds 6 cab records	**Ready ' '**
Demo Account Credentials	Test clicking 1-Click buttons on <code>`/login`</code>	Instant login with <code>`sumiya@ucab.com`</code>	**Ready ' '**

2. Contingency & Fallback Strategy

Scenario A: University WiFi / Internet Disconnects During Demo

- Impact: High (External APIs or CDN fonts might fail).
- Solo Developer Solution: `UCab` uses local vector icons (`Lucide React`) and locally bundled packages. Furthermore, because our backend includes the Zero-Config File Storage Engine (`store.js`), you can completely disconnect your laptop from the internet (`Airplane Mode`) and the application will run 100% locally on `localhost:8000` and `localhost:5173` without a single hiccup.

Scenario B: Local MongoDB Service Stops Working on Grader PC

- Impact: Critical for traditional MERN apps (server crashes with `MongoNetworkError`).
- Solo Developer Solution: Our server explicitly catches connection timeouts (`config.js`) and prints:
``& p MongoDB local engine not found... '( Automatic Zero-Config MERN Fallback Activated!``
The demo proceeds seamlessly using ``server/db/data.json``.
